

Autism & Applied Behavioral Analysis (ABA) **Information**

Applied Behavioral Analysis (ABA) is used to target the acquisition of developmentally appropriate skills across settings- particularly social, communication, and daily living skills at home, school, and in the community as well as to reduce problem behaviors.

The ABA process will begin with a Functional Behavioral Analysis conducted by a board-certified Behavioral Analyst. The behavioral analyst should be provided with a copy of the Autism evaluation. The behavioral Analyst will create a report and treatment plan at home, clinic, and school.

Since symptoms will impair learning and academic performance, an Individualized Education Plan (IEP) and/or a 504 Plan with specific accommodations is warranted.

An IEP should be consistently monitored for progress and the effectiveness of the interventions. It is important to have continued interventions to acquire foundational and functional academic skills, helping decrease behavioral problems and increase age-appropriate language, motor, play, and social skills.

A structured classroom environment with individual attention is important. This classroom setting should have a low student-to-teacher ratio to ensure appropriate learning and a program to accommodate social, emotional, and behavioral needs.

A predictable routine with transitions and follow-through may reduce anxiety. Changes in the normal routine should be introduced gradually, giving your child time to acclimate and prepare.

A highly structured environment and parent training will help parents learn how to incorporate the needed structure into their home, trips into the public setting, and manage anxieties and problem behaviors when routines change.

Children should be closely monitored by a speech and language pathologist and receive the necessary therapy to help to improve expressive and receptive language skills. Occupational therapy services help to improve motor skills (i.e., especially visual-motor integration) and self-care skills.

Your child should receive consistent follow-up assessments to monitor their progress.

Northeastern Early Steps (NES) is a medical service program with the Department of Pediatrics at the University of Florida College of Medicine-Jacksonville. NES offers developmentally supportive early intervention services for infants and toddlers from birth to 3 years of age with developmental delays or who may be at risk for developmental delay. NES serves families in Duval, Clay, St. Johns, Nassau, Baker, and Bradford Counties.

Phone: (904) 633-0760

The Early Start Denver Model (ESDM) is a 16-week multimodal therapy program for newly diagnosed autistic children. Wolfson Children's Hospital offers the program for children from 18 months to 4 years old.

This program is a short-term treatment option. It is based on Applied Behavior Analysis (ABA) methods and can assist with therapy & developmental goals, often while on the waitlist to start long-term ABA therapy.

Parents and therapists use play to build positive and fun relationships. Play, and joint activities encourage The child to boost language, social and cognitive skills.

Website: [Wolfson Children's Early Autism Program](#)

Early intervention is essential for the treatment of Autism. Behavioral therapy must be led by board-certified behavioral analysts (BCBAs). It is recommended that parents visit several practices to pick the best fit for the family. Applied Behavioral Analysis can be enjoyable for the child, but it is time-consuming and requires several hours each week to be effective. Typically, ABA is conducted in a clinic and at home.

ABA Providers

Great Strides Rehabilitation has locations in both Duval and Clay County. Great Strides is an ABA therapy clinic that offers services in the clinic and the home, and they also have a private school program for children with special needs, speech, occupational, and physical therapists on site, and social skill-building group therapy programs.
